Engine - V8 5.0L Petrol - Engine

Description and Operation

EXTERNAL VIEW

E122432

INTRODUCTION

The 5.0L NA (naturally aspirated) gasoline engine is a liquid cooled V8 unit featuring direct fuel injection, four overhead camshafts and four valves per cylinder. All four camshafts incorporate **VCT (variable camshaft timing)**. The intake camshafts and valves also incorporate CPS (camshaft profile switching).

The main structural components of the engine are all manufactured from aluminum alloy. The engine is built around a very stiff, lightweight, enclosed V, deep skirt cylinder block. A structural windage tray is bolted to the bottom of the cylinder block to further improve the block stiffness, minimize **NVH (noise, vibration and harshness)** and help reduce oil foaming. To further enhance the stiffness of the lower engine structure, a heavily ribbed sump is installed. The sump also helps to reduce engine noise.

Engine Structure

E121104

Item	Part Number	Description
1	-	LH (left hand) cylinder head (bank B)
2	-	Cylinder block
3	-	Windage tray
4	-	Sump
5	-	RH (right hand) cylinder head (bank A)

CYLINDER BLOCK

E106725

The cylinder block is a 90 degree configuration with cast-in iron cylinder liners and an open deck die-cast coolant jacket. The low volume coolant jacket gives good warm-up times and low piston noise levels. The longitudinal flow design of the coolant jacket, with a single cylinder head coolant transfer port in each bank, provides good rigidity and head gasket sealing.

Cylinder Numbering

The cylinders are numbered as shown below, with cylinders 1 and 2 at the front of the engine.

E133972

E108429

Item	Part Number	Description
1	-	Engine data location

Engine data is marked on the cylinder block at the rear of the [RH \(right-hand\)](#) cylinder bank.

CRANKSHAFT

E106729

The crankshaft is made from spheroidal graphite cast iron, which, compared with grey cast iron, has higher mechanical strength, ductility and increased shock resistance. The undercut and rolled fillets also improve strength. Eight counter-balance weights ensure low vibration levels and the large, cross-drilled main bearing journals are designed to contribute to stiffness.

An oil groove in the upper half of each main bearing transfers the oil into the crankshaft for lubrication of the connecting rod bearings. A thrust washer is installed each side of the top half of the center main bearing.

Crankshaft Data Location

E108430

Item	Part Number	Description
1	-	Pin journal classification and plant identification
2	-	Main journal classification
3	-	Date and time codes

The main bearings are numbered 1 to 5 starting from the front of the engine. There are five grades of main bearing available, each being color coded. Journal sizes are marked on the rear of the crankshaft.

For additional information, refer to: [Crankshaft Main Bearing Journal Clearance](#) (303-00 Engine System - General Information, General Procedures).

Crankshaft Installation

E122349

Item	Part Number	Description
1	-	Coolant drain plug
2	-	Torque converter access plug
3	-	Drive plate
4	-	Rear cover
5	-	Main bearing cap
6	-	Identification mark
7	-	Front cover
8	-	Front pulley

The main bearing caps are made from cast iron and are cross bolted to increase rigidity. An identification mark on the bearing cap faces the front of the engine.

At the front of the crankshaft, a tuned torsional vibration damper is incorporated into the crankshaft front pulley. At the rear of the crankshaft a pressed steel drive plate, with a steel starter ring gear, is installed to transfer drive from the engine to the transmission. The reluctor ring for the [CKP \(crankshaft position\)](#) sensor is integrated into the perimeter of the drive plate.

The crankshaft seals are located in the front and rear covers.

PISTONS AND CONNECTING RODS

E115619

The diameter of each piston is graded and precisely matched to each cylinder bore to help reduce noise. In the vertical plane, the pistons have a slight barrel form, which helps to ensure a reliable oil film is maintained between the piston and the cylinder bore. A solid film lubricant coating is applied to both reaction faces of the piston to reduce wear and improve fuel economy.

A three-ring piston-sealing system is used. The steel top ring is treated with a PVD (physical vapor deposition) peripheral coating. PVD is a coating technique where material can be deposited with improved properties to ensure good cylinder bore compatibility and wear resistance. A Napier center ring helps cylinder pressure and oil management, while the three-piece oil control lower ring is produced from nitrided steel.

The connecting rods are forged from high strength steel. The cap is fracture-split from the rod to ensure precision re-assembly for bearing shell alignment. There are three grades of large end bearing available, each being color coded. For additional information, refer to: [Connecting Rod Large End Bore](#) (303-00 Engine System - General Information, General Procedures).

Cap Alignment with Connecting Rod

E108438

Item	Part Number	Description
1	-	Alignment marks
2	-	Connecting rod
3	-	Cap
4	-	Bearings

The correct alignment of the cap with the connecting rod is indicated by marks on adjacent faces of the two components.

Connecting Rod and Piston Orientation

E108439

Item	Part Number	Description
A	-	Front of engine
1	-	Alignment mark
2	-	LH side (bank B)
3	-	Alignment mark
4	-	RH side (bank A)
5	-	Piston orientation arrow

The orientation of the connecting rods and pistons on the crankshaft are given below:

- Bank A - The arrow on the piston crown must face the front of the engine and the cap and connecting rod alignment marks must face the rear of the engine.
- Bank B - The arrow on the piston crown must face the front of the engine and the cap and connecting rod alignment marks must face the front of the engine.

CYLINDER HEADS

- NOTE: [RH](#) (A bank) cylinder head shown, LH (left-hand) (B bank) cylinder head similar.

E106732

The cylinder heads are manufactured in gravity die cast aluminum alloy and are unique for each cylinder bank. Deep-seated bolts reduce distortion and secure the cylinder heads to the cylinder block.

Each cylinder is served by four valves. To help achieve the required gas-flow characteristics, these are arranged asymmetrically around the cylinder bore. Each cylinder has a centrally mounted fuel injector and spark plug.

The cylinder head gasket is of a multi-layer steel construction.

EXHAUST MANIFOLD

- NOTE: LH (B bank) installation shown, RH (A bank) installation similar.

E118618

Item	Part Number	Description
1	-	Cylinder head
2	-	Gasket
3	-	Heat shield
4	-	Gasket
5	-	Exhaust manifold
6	-	Bolt (8 off)
7	-	Heat shield
8	-	Bolt (4 off)
9	-	Spacer (8 off)

The high SiMo (silicon molybdenum) cast iron exhaust manifolds are unique for each cylinder bank. Each exhaust manifold installation includes two metal gaskets and two heat shields. Spacers on the securing bolts allow the manifolds to expand and contract with changes of temperature while maintaining the clamping loads.

VALVE TRAIN

E106733

Item	Part Number	Description
1	-	VCT solenoids
2	-	CPS solenoids
3	-	Inverted tooth timing chain
4	-	Nylon chain guide
5	-	Auxiliary chain tensioner
6	-	Auxiliary drive chain
7	-	Oil pump drive
8	-	Auxiliary drive camshaft
9	-	Timing chain tensioner
10	-	Tensioner lever
11	-	VCT unit

Camshafts

E108443

Item	Part Number	Description
1	-	Intake camshaft
2	-	Exhaust camshaft

The lightweight valve train provides good economy and noise levels and is chain driven from the crankshaft.

Double overhead camshafts on each cylinder head operate the valves. For each cylinder head, an inverted tooth timing chain transfers drive from the crankshaft to the [VCT](#) unit on the front of each camshaft. Graded tappets enable setting of exhaust valve clearances. Switchable tappets with hydraulic lash adjusters are installed on the intake valves.

Each timing chain has a hydraulic tensioner operated by engine oil pressure. The chain tensioners incorporate a ratchet mechanism, which maintains tension while the engine is stopped to eliminate start-up noise. The chains are lubricated with engine oil from jets located at the front of the engine block. Nylon chain guides control chain motion on the drive side.

Variable Camshaft Timing

Item	Part Number	Description
1	-	VCT units
2	-	Intake camshaft VCT solenoid
3	-	Camshaft position sensors
4	-	Exhaust camshaft VCT solenoid

The [VCT](#) system varies the timing of the intake and exhaust camshafts to deliver optimum engine power, efficiency and emissions. The timing of the intake camshafts has a range of 62 degrees of crankshaft angle. The timing of the exhaust camshafts has a range of 50 degrees of crankshaft angle.

In the base timing position:

- The intake camshafts are fully retarded.
- The exhaust camshafts are fully advanced.

VCT Operating Ranges

Camshaft	Valve Opens	Valve Closes
Intake - Low Lift	27 degrees BTDC (before top dead center) to 35 degrees ATDC (after top dead center)	187 to 249 degrees ATDC
Intake - High Lift	37 degrees BTDC to 25 degrees ATDC	213 to 275 degrees ATDC
Exhaust	244 to 194 degrees BTDC	6 to 56 degrees ATDC

The system consists of a [VCT](#) unit and a [VCT](#) solenoid for each camshaft. The [ECM](#) (engine control module) controls the system using [PWM](#) (pulse width modulation) signals to the [VCT](#) solenoids.

The torsional energy generated by the valve springs and the inertia of the valve train components are used to operate the system.

Variable Camshaft Timing Units

The [VCT](#) units change the position of the camshafts in relation to the timing chains.

E115930

Item	Part Number	Description
1	-	Bolt (3 off)
2	-	VCT unit
3	-	Filter
4	-	Camshaft
5	-	Inner plate
6	-	Housing and sprocket
7	-	Rotor assembly
8	-	Reed plate
9	-	Spring and lock pin
10	-	Spring (3 off)
11	-	Tip seal (3 off)
12	-	Spring (2 off)
13	-	Tip seal (2 off)
14	-	Spring
15	-	Dowel pin
16	-	Bias spring
17	-	Snap ring
18	-	Reluctor ring
19	-	Center plate
20	-	Snap ring
21	-	Screw (6 off)
22	-	Spool valve
23	-	Outer plate

Each [VCT](#) unit is attached to the camshaft by three bolts. A rotor assembly and a reed plate are installed inside a sprocket

housing, which consists of a sprocket, an outer plate and an inner plate held together by six screws.

A reluctor ring, for the [CMP \(camshaft position\)](#) sensor, a center plate and a bias spring are installed at the front of the [VCT](#) unit. The ends of the bias spring locate on the center plate assembly and the sprocket housing, to give a turning moment to the camshaft in the advance direction. A snap ring locates the reluctor ring on to a sleeve installed in the center of the rotor assembly. The opposite end of the sleeve locates in a bore in the front face of the camshaft, which contains a filter.

A spring and spool valve are installed in the rotor assembly sleeve and retained by a snap ring. The spring keeps the spool valve in contact with the armature of the related [VCT](#) solenoid.

Each [VCT](#) unit is supplied with engine oil from an oil gallery in the cylinder head, through the camshaft front bearing cap and a bore in the center of the camshaft.

Variable Camshaft Timing Solenoids

The [VCT](#) solenoids control the position of the spool valves in the [VCT](#) units.

E115929

The [VCT](#) solenoids are installed in the front upper timing covers, immediately in front of their related [VCT](#) units. Each [VCT](#) solenoid is secured with two screws and sealed with an O-ring. A two pin electrical connector provides the interface with the engine harness.

Each [VCT](#) solenoid incorporates a spindle that acts on the spool valve in the related [VCT](#) unit to advance and retard the camshaft timing. The [VCT](#) solenoids operate independently and are controlled by a [PWM](#) signal from the [ECM](#).

Variable Camshaft Timing Operation

When the engine is running, the compression and expansion of the valve springs causes momentary increases and decreases in the torque acting on the camshafts. These momentary changes of torque are sensed in the [VCT](#) units and used to change the camshaft timing.

Camshaft Torsional Energy (For a Single Valve Event)

E112406

Item	Part Number	Description
A	-	Camshaft torque
B	-	Camshaft rotation (degrees)
C	-	Valve opening
D	-	Peak lift
E	-	Valve closing
1	-	1000 rev/min
2	-	4000 rev/min
3	-	7000 rev/min
4	-	Inertia effects from valve train rotating components
5	-	Force caused by valve spring
6	-	Bias torque from friction

Variable Camshaft Timing Unit Schematic - Base Timing

- NOTE: Intake camshaft [VCT](#) unit shown. For exhaust camshaft [VCT](#) unit, read advance for retard and retard for advance.

E115931

Item	Part Number	Description
1	-	Advance chamber
2	-	Retard chamber
3	-	Sprocket housing
4	-	Rotor assembly
5	-	Lock pin
6	-	Sleeve
7	-	Engine oil supply from camshaft
8	-	Inlet check valve
9	-	Lock pin drain
10	-	Spool valve
11	-	Advance check valve
12	-	Retard check valve

• NOTE: The following description is for intake camshaft [VCT](#) units. For exhaust camshaft [VCT](#) units, read advance for retard, and retard for advance.

At engine start-up, once the engine oil pressure in the camshaft is sufficient to open the inlet check valve, engine oil flows across the spool valve, through the advance and retard check valves and into the advance and retard chambers. During the start cycle, the [ECM](#) signals the [VCT](#) solenoid to move the spool valve into the sleeve and connect the lock pin to inlet oil pressure. The inlet oil pressure causes the lock pin to retract from the inner plate and unlock the rotor assembly and camshaft from the sprocket housing.

There is a constant supply of oil to the [VCT](#) to ensure the unit remains filled during operation.

Variable Camshaft Timing Unit Schematic - Advance

E115932

To advance the camshaft timing, the [ECM](#) adjusts the signal to the [VCT](#) solenoid to move the spool valve so that the advance chamber oil passage is closed and the retard chamber oil passage is connected to inlet oil.

Each momentary increase of the torque acting on the camshaft generates a pressure pulse in the retard chamber. Oil moves from the retard chamber, through the spool valve and the advance check valve to the advance chamber, to equalize the pressures in the two chambers. The displacement of oil from the retard chamber causes the rotor assembly to advance in relation to the sprocket housing. Each momentary decrease of torque acting on the camshaft also generates a pressure pulse in the advance chamber, but, with the advance chamber oil passage closed, no movement of oil between the advance and retard chambers occurs and the rotor assembly cannot move in the retard direction.

Variable Camshaft Timing Unit Schematic - Null

E115933

Once the camshaft has reached the required timing position the [ECM](#) adjusts the signal to the [VCT](#) solenoid to set the spool valve in the null position. In the null position, the advance and retard chamber oil passages are both closed by the spool valve and the rotor assembly is hydraulically locked to the sprocket housing.

Variable Camshaft Timing Unit Schematic - Retard

E115934

To retard the camshaft timing, the [ECM](#) adjusts the signal to the [VCT](#) solenoid to move the spool valve to close the retard chamber oil passage and connect the advance chamber oil passage to the inlet oil.

Each momentary decrease of the torque acting on the camshaft causes oil to transfer from the advance chamber, through the spool valve and the retard check valve to the retard chamber, and so retard the camshaft timing.

Camshaft Profile Switching

E106735

The CPS (camshaft profile switching) system switches the intake valves between two cam profiles which have different lift and period. The low lift profile improves driveability and emissions at lower engine speeds. The high lift profile improves power and torque output at higher engine speeds.

The intake camshafts have three lobes for each valve. The two outer lobes have identical profiles that produce the high lift of 10.53 mm (0.415 in.). The central lobe produces the low lift of 5.50 mm (0.217 in.). Switching between cam profiles is performed by a switchable tappet on each intake valve. The switchable tappets are operated by engine oil controlled by a CPS solenoid on each cylinder head. Operation of the CPS solenoids is controlled by the [ECM](#).

Camshaft Profile Switching Solenoids

E115935

The CPS solenoids control the supply of engine oil pressure to the locking pins in the switchable tappets, to switch the tappets between the two cam profiles.

A CPS solenoid is installed on the rear of each cylinder block. Each CPS solenoid has a pintle installed in a sleeve, which incorporates oil inlet and outlet holes. The sleeve is installed at the junction of oil galleries in the cylinder head, with the oil inlet and outlet holes aligned with the galleries. Movement of the pintle in the sleeve controls a connection between the oil galleries. When the CPS solenoid is energized, the pintle connects an oil supply gallery to the gallery along the outboard side of the switchable tappets. When the CPS solenoid is de-energized, the oil gallery along the outboard side of the switchable tappets is connected to drain.

The CPS solenoids receive a fused battery supply from the main relay. The [ECM](#) switches a ground connection to operate the solenoids.

Switchable Tappets

E89601

Item	Part Number	Description
1	-	Outer tappet
2	-	Outer locking pin
3	-	Inner locking pin
4	-	Return spring
5	-	Lash adjuster oil inlet
6	-	Lash adjuster
7	-	Lost motion spring
8	-	CPS oil inlet
9	-	Anti-rotation lug

The switchable tappets are installed on the intake valves, in bores in the cylinder heads. The cylinder heads incorporate engine oil galleries along the inboard and outboard sides of the bores. The inboard oil galleries (between the tappets and the spark plug/fuel injector bores) supply an oil feed to the locking pins in the switchable tappets. The outboard oil galleries (over the inlet ports) supply an oil feed to the hydraulic lash adjusters in the switchable tappets.

Each switchable tappet consists of inner and outer tappets, which can operate independently or be locked together by locking pins. A hydraulic lash adjuster on the bottom of the inner tappet locates on the intake valve stem.

In low lift, the intake valve lift is controlled by the inner tappets, which run on the center lobes of the intake camshafts. The outer tappets run on the outer lobes of the intake camshafts, and move up and down the inner tappets without affecting the valve lift. The lost motion springs keep the outer tappets in contact with the outer lobes. Movement of the inner tappets is transferred to the intake valves through the hydraulic lash adjusters.

In high lift, engine oil is supplied to the locking pins, which lock the outer tappets to the inner tappets. Intake valve lift is controlled by the outer tappets, which run on the outer lobes of the intake camshafts. Movement of the outer tappets is transferred to the intake valves through the locking pins, the inner tappets and the hydraulic lash adjusters.

E108445

Item	Part Number	Description
------	-------------	-------------

1	-	Intake camshaft
2	-	Inner tappet
3	-	Outer tappet
4	-	Outer cam profile (high lift)
5	-	Inner cam profile (low lift)
6	-	Locking pin oil pressure inlet
7	-	Outer locking pin
8	-	Inner locking pin
9	-	Outer tappet lost motion spring
10	-	Valve spring

Camshaft Profile Switching Operation

The switching point is speed and load dependent. This strategy ensures that switching occurs at air flow neutral points in the engine's operation and is imperceptible to the driver.

At engine speeds from idle up to the range of 2825 - 4250 rev/min (depending on engine load), the CPS solenoids are de-energized and the switchable tappets are set to low lift. At engine speeds above the 2825 - 4250 rev/min range, the CPS solenoids are energized by the [ECM](#) and the switchable tappets are set to high lift. There is a 200 rev/min hysteresis when switching from high lift to low lift with decreasing engine speed. Switching between lift settings occurs within one revolution of the camshaft.

Switching is only enabled at engine oil temperatures of 20 °C (68 °F) and above. At oil temperatures below 20 °C (68 °F), CPS operation is disabled and the switchable tappets remain in the low lift setting. CPS operation is also disabled if a CPS solenoid fails. When CPS operation is disabled, engine speed is limited to 5000 rev/min.

The [ECM](#) can diagnose the operation of the CPS solenoids and store fault related [DTC \(diagnostic trouble code\)](#) if it detects a failure.

LUBRICATION SYSTEM

E118619

Item	Part Number	Description
1	-	Oil pump outlet tube
2	-	Anti-drain valve
3	-	Oil cooler
4	-	Oil filter
5	-	Timing chain lubrication jet (2 off)
6	-	Oil evacuation tube
7	-	Oil pump
8	-	Oil pick-up
9	-	Oil temperature and level sensor

The oil pump is attached to the underside of the windage tray. The input shaft of the oil pump is driven from the front of the crankshaft, by the auxiliary chain, at 0.87 engine speed.

The oil pump draws oil from the sump through a centrally mounted pick-up pipe. The oil is pressurized and pumped through an output tube to the cylinder block. After passing through an anti-drain valve and a plate type oil cooler, the oil is filtered by a replaceable cartridge installed on the front of the [RH](#) cylinder head.

The output from the oil filter is distributed through oil galleries in the cylinder heads and cylinder block. All moving parts are lubricated by pressure or splash oil. Pressurized oil is also provided for the [VCT](#) system, the CPS system, the timing chain tensioners and the timing chain lubrication jets.

The oil returns to the oil pan under gravity. Large drain holes through the cylinder heads and cylinder block ensure the rapid return of the oil to the sump. System replenishment is through the oil filler cap on the [LH](#) cylinder head cover.

An oil evacuation tube is installed to allow oil to be drawn from the sump. The upper end of the oil evacuation tube is located under the oil filler cap.

An oil drain plug is installed in the [RH](#) side of the sump.

Oil Pump Nominal Operating Pressures

Engine Speed, rev / min	Temperature, °C (°F)	Pressure, bar (lbf/in ²)
Idle	20 (68)	2.0 (29.0)
1500	20 (68)	6.0 (87.0)
3000	40 (104)	6.2 (90.0)
3000	110 (230)	5.0 (72.5)
3000	130 (266)	4.0 (58.0)

Oil Level Monitoring

Oil level monitoring is provided by an oil level and temperature sensor that measures the oil level in the sump. The oil level can be displayed in the message center of the instrument cluster.

Oil Level and Temperature Sensor

E115936

The oil level and temperature sensor supplies the [ECM](#) with a signal containing the level and temperature of the oil in the sump. The oil level and temperature sensor is secured to the bottom of the sump with three screws and sealed with a gasket.

The oil level and temperature sensor sends an ultrasonic pulse vertically upward and measures the time taken for the pulse to be reflected back from the top surface of the oil. This time is compared with the time taken for an ultrasonic pulse to travel a reference distance within the oil level and temperature sensor to determine the oil level. The oil level reading is combined with the oil temperature reading and transmitted in a [PWM](#) signal to the [ECM](#).

Oil Level and Temperature Sensor Specifications

Feature	Details
Power Source	Battery Voltage
Level Accuracy	±2 mm (±0.08 in.) at temperatures of -30 °C (-22 °F) and above; (±4 mm (±0.16 in.) at temperatures below -30 °C (-22 °F))
Temperature Accuracy	±2 °C (±3.6 °F)
Operating Level Range	116 to 147 mm (4.57 to 5.79 in.)
Operating Temperature Range	-40 to 160 °C (-40 to 320 °F)

Oil Level Check

For additional information, refer to: [Engine Oil Draining and Filling](#) (303-01D Engine - V8 5.0L Petrol, General Procedures).

For accuracy, oil level checks should be performed with the vehicle on level ground when the oil is hot. The vehicle needs to stand for approximately 10 minutes, after the engine is switched off, to allow the oil to drain back into the sump and the oil level to stabilize. The oil level system will not give a reading until the oil level has stabilized.

To check the oil level, make sure that the ignition is on, the engine stopped and the transmission is in P (park). Access the vehicle information and settings menu, then select **Oil Level Display** from the **Service Menu**. An **Engine Oil Level** sight glass will be displayed in the message center. The current oil level will be displayed in the sight glass. One of the following messages will also be displayed:

- If the oil level is within acceptable limits, the message **Level OK** is displayed.
- If the oil level is less than acceptable, a message advising how much oil to add is displayed e.g. **Add 1 Litre**, or **Add 1 Quart**, depending on the market.
- If the message **Overfilled** is displayed, the oil level must be reduced to within acceptable limits before starting the engine again.
- If the message **Not available** is displayed, the oil level is still stabilizing. Wait 10 minutes and then recheck level.

E121582

Engine - V8 5.0L Petrol - Engine

Diagnosis and Testing

For additional information, refer to Diagnosis and Testing, Engine - 5.0L

REFER to: [Engine - V8 5.0L Petrol](#) (303-00 Engine System - General Information, Diagnosis and Testing).

Engine - V8 5.0L Petrol - Engine Oil Draining and Filling

General Procedures

Draining

WARNING: The spilling of hot engine oil is unavoidable during this procedure, care must be taken to prevent scalding.

CAUTION: Correct installation of the oil filler cap can be obtained by tightening the cap until hard stop.

- **NOTE:** Clean the components general area prior to dismantling.

1. **CAUTION:** Make sure the engine is warm.

Start the engine and allow to run for 10 minutes, stop the engine.

2.

3. Refer to: [Engine Cover - V8 5.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

4.

- Loosen the element cover 4 complete turns to allow engine oil to drain from the filter cover.
- Make sure that the O-ring seal is exposed.

5. **NOTE:** Allow 10 minutes for the engine oil to drain from the oil filter housing.

WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

8. Refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

9. **9. CAUTIONS:**

Be prepared to collect escaping oil.

Allow at least 10 minutes for the engine oil to drain.

- NOTE: Discard the sealing washer.

Filling

1. **10. ⚠ CAUTION:** Make sure that the area around the component is clean and free of foreign material.

- NOTE: Install a new sealing washer.

Torque: 24 Nm

2. Refer to: [Engine Undershield](#) (501-02 Front End Body Panels, Removal and Installation).

3. **12. NOTE:** Install new O-ring seals.

Lubricate the oil filter element O-ring seal with clean engine oil.

4. **13. ⚠ CAUTION:** Tighten the component finger tight first.

- Torque: 25 Nm

5. **14.**  **CAUTION:** Make sure that the vehicle is left for 5 minutes from filling with oil and that the engine oil level is reading at least minimum (by following Steps 9-15), before starting the engine.

- Fill the engine with oil - for filling values on vehicles without supercharger:

Refer to: [Specifications](#) (303-01D Engine - V8 5.0L Petrol, Specifications).

- Fill the engine with oil - for filling values on vehicles with supercharger:

Refer to: [Specifications](#) (303-01D Engine - V8 5.0L Petrol, Specifications).

- Clean any residual engine oil from the oil filler cap area.

6.

7. **16.**  **CAUTION:** Make sure that the vehicle has been left for 5 minutes from filling with oil.

Follow the Steps 9-15 before starting the engine.

8.

- Start the engine and allow to run for 10 minutes, stop the engine.
- Check for leaks.

9. **18.** **CAUTIONS:**

Make sure that the selector lever and the gearshift mechanism are in the park (P) position.

Make sure that the hood is open.

- Turn the ignition on.

10.

- Press the right-hand directional button to access the instrument cluster menu.

E123926

11.

- Press the right-hand OK button.

E123925

12.

- Press the right-hand directional button to access the Oil Level Display.

E123927

13.

- Press the right-hand OK button and follow the instructions.

E123928

E121008

14.

- Press the cruise control cancel button twice within 2 seconds.

15.

- The message center display will revert to the normal display in the trip computer.
- Press the right-hand OK button and follow the instructions.
- Check that the oil level display shows an oil level reading.
- Only after having started and run the engine for 10 minutes (as indicated in Step 8), switch off the engine, then stabilizing for 10 minutes, take a reading from the oil level display and, if necessary top up with engine oil.

E123929

16. **25. NOTE:** If instructed to follow Steps 9-15 in a previous step, return to Step 8 and continue the procedure.

Turn the ignition off.

17. Allow 10 minutes for the engine oil level to stabilize if there has been additional oil top up.

E121008

18. **27. NOTE:** The following steps are to update the average oil level value.

- Turn the ignition on.
- Press and hold the cruise control cancel button for more than 2 seconds.

19.

- The message center display will revert to the normal display in the trip computer.

20. Turn the ignition off.

21. Turn the ignition on.

22.

- Press the right-hand directional button to access the instrument cluster menu.

E123926

E123925

23.

- Press the right-hand OK button.

24.

- Press the right-hand directional button to access the Oil Level Display.

E123927

25.

- Press the right-hand OK button and follow the instructions.
- Make sure that the average oil level value has now been updated.

E123929

26. Refer to: [Engine Cover - V8 5.0L Petrol](#) (501-05 Interior Trim and Ornamantation, Removal and Installation).

Engine - V8 5.0L Petrol - Engine Oil Vacuum Draining and Filling

General Procedures

Special Tool(s)

- Check that the oil level display shows an oil level reading.
- Only after having started and run the engine for 10 minutes (as indicated in Step 6), switch off the engine, then stabilizing for 10 minutes, take a reading from the oil level display and, if necessary top up with engine oil.

14. **22. NOTE:** If instructed to follow Steps 7-13 in a previous step, return to Step 6 and continue the procedure.

Turn the ignition off.

15. Allow 10 minutes for the engine oil level to stabilize if there has been additional oil top up.

E121008

16. **24. NOTE:** The following steps are to update the average oil level value.

- Turn the ignition on.
- Press and hold the cruise control cancel button for more than 2 seconds.

17.

- The message center display will revert to the normal display in the trip computer.

18. Turn the ignition off.

20.

- Press the right-hand directional button to access the instrument cluster menu.

E123926

21.

- Press the right-hand OK button.

E123925

22.

- Press the right-hand directional button to access the Oil Level Display.

E123927

23.

- Press the right-hand OK button and follow the instructions.
- Make sure that the average oil level value has now been updated.

E123929

24. Refer to: [Engine Cover - V8 5.0L Petrol](#) (501-05 Interior Trim and Ornamentation, Removal and Installation).

Engine - V8 5.0L Petrol - Camshaft LH

Removal and Installation

Removal

CAUTION: Make sure that the orientation and code on the top of the camshaft bearing caps is noted (along with the bank - A or B), so that on installation the components are installed to their original position. Failure to follow this instruction may cause damage to the vehicle.

- NOTE: Removal steps in this procedure may contain installation details.
- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2. **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Timing Drive Components - Assembly Part Number: INA Timing Drive](#) (303-01D Engine - V8 5.0L Petrol, Removal and Installation).

4. **CAUTIONS:**

CAUTION: Rotate the camshafts until all the valves are at their minimum open point.

CAUTION: Evenly and progressively, release the camshaft bearing caps.

- NOTE: Remove the camshaft bearing caps. Note: their position, orientation and markings. Each is marked with its position (number) and an orientation (arrow).

Installation

1. **CAUTIONS:**

CAUTION: Prior to installing the camshafts, position the crankshaft 45 degrees ATDC cylinder 1A to prevent valve/piston collision.

CAUTION: Make sure that the camshafts and camshaft bearing caps are installed in their original locations.

CAUTION: Evenly and progressively install and tighten the camshaft bearing caps.

- NOTE: Lubricate the camshafts and the camshaft bearing caps with EP90 oil (or 75/90 viscosity oil will suffice) prior to installation.

Torque: 3 Nm

2. **2. NOTE:** Tighten the bolts in the indicated sequence.

Torque: 12 Nm

3. **3. ⚠ CAUTION:** Only rotate the crankshaft clockwise.

Rotate the crankshaft until the camshaft lobe on the valve being checked is 180 degrees from the maximum opening position.

4. **4. NOTE:** If the valve clearance is incorrect, continue to the next step. If the valve clearance is correct, continue to step 8.

• **NOTE:** On vehicles without supercharger the inlet camshaft valve clearances cannot be checked.

Using feeler gauge check the gap between the tappet and the camshaft lobe and check against specifications table.

5. **5. CAUTIONS:**

Do not use a magnet to remove the tappet.

Use the following formula to calculate the required bucket thickness. Original thickness + measured clearance - desired clearance = required bucket thickness.

Remove the tappet and measure the thickness.

6. **6. NOTE:** If a new tappet is installed then go back to step 1 of the install procedure.

Install a new tappet if required.

7. Using feeler gauge check the gap between the tappet and the camshaft lobe and check against specifications table.

8. Refer to: [Timing Drive Components - Assembly Part Number: INA Timing Drive](#) (303-01D Engine - V8 5.0L Petrol, Removal and Installation).

9. Connect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V8 5.0L Petrol - Camshaft RH

Removal and Installation

Removal

9. Torque: 12 Nm

10.

11. **11.**  **CAUTION:** Make sure that the mating faces are clean and free of corrosion and foreign material.

Torque:

Stage 1: 40 Nm
Stage 2: 180°

Installation

1. To install, reverse the removal procedure.

Engine - V8 5.0L Petrol - Fuel Pump Camshaft Assembly Part Number: INA Timing Drive

Removal and Installation

Removal

- NOTE: Some illustrations may show the engine removed for clarity.

1. Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Oil Pan Extension](#) (303-01D Engine - V8 5.0L Petrol, Removal and Installation).

4.

5.

6.

7.  CAUTION: Take extra care when removing the component, prevent damage to the mating faces.

Installation

1.  CAUTION: Make sure that the mating faces are clean and free of foreign material.

2.  CAUTION: Take extra care not to damage the mating faces.

Torque: 12 Nm

3. Torque: 21 Nm

4. Torque: 12 Nm

5. Install the lower timing chain making sure the coloured chain links align correctly with the fuel rail high-pressure fuel pumps camshaft and crankshaft sprocket markings.

6.  **CAUTION:** Make sure that the tensioner spring is correctly located.

Torque: 21 Nm

7. Refer to: [Oil Pan Extension](#) (303-01D Engine - V8 5.0L Petrol, Removal and Installation).
8. Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

Engine - V8 5.0L Petrol - Fuel Pump Camshaft Assembly Part Number: Tsubaki Timing Drive

Removal and Installation

Removal

- NOTE: Some illustrations may show the engine removed for clarity.

1. Disconnect the battery ground cable.

Refer to: [Specifications](#) (414-00 Battery and Charging System - General Information, Specifications).

2.  **WARNING:** Make sure to support the vehicle with axle stands.

Raise and support the vehicle.

3. Refer to: [Oil Pan Extension](#) (303-01D Engine - V8 5.0L Petrol, Removal and Installation).

4.

5.

6.

7.  CAUTION: Take extra care when removing the component, prevent damage to the mating faces.

Installation

1.  CAUTION: Make sure that the mating faces are clean and free of foreign material.

2.  CAUTION: Take extra care not to damage the mating faces.
