

Parking Aid - Overview

Overview

The vehicle may be equipped with:

- Rear only parking aid camera system
- 360 degree view camera system

Rear Only Parking Aid Camera

The rear parking aid camera system visually aids the driver while reversing or reverse parking the vehicle. The camera system has features that provide fixed and active guideline overlays on the video image to assist the driver in aligning the vehicle and a visual alert function that provides a visual highlight in the zone where an object is detected by the audible parking aid system.

360 Degree View Camera

The 360 degree view camera system provides several different camera views to visually aid the driver while maneuvering the vehicle at low speed. The camera system is enabled by selecting reverse gear or pressing the 360 degree camera switch when any gear except reverse is selected. The camera views are changed using the 360 degree camera switch and the available camera views are dependent upon the transmission gear selection. The camera system has features that provide fixed and active guideline overlays on the rear normal view video image to assist the driver in aligning the vehicle and a visual alert function that provides a visual highlight on the rear normal and 360 degree view images in the zone where an object is detected by the audible parking aid system.
