

Universal Transmitter - System Operation and Component Description

System Operation

Universal Transmitter

The universal transmitter learns a hand-held transmitter radio frequency code and stores the code in memory. It consists of 3 buttons with an indicator lamp. Once the universal transmitter code is stored, the universal transmitter emits the radio frequency of the hand-held transmitter when the corresponding button is pressed. The universal transmitter can store 3 unique transmitter codes at a time. The universal transmitter and LH vanity mirror lamp are part of the LH sun visor and share the same power and ground circuits.
