

Description and Operation

General information

First of all, the spring rate of the front coil springs has been reduced compared with the previous model, leading to an improved driving behavior of the vehicle.

In addition, the lower arms are made from high-strength steel and their mountings have been strengthened by suitable measures. Compared with the previous model, use of this high-strength material has both increased the stability and also reduced the weight.

The front stabilizer bar has also been strengthened, leading to a considerable increase in its torsional rigidity and thus to substantially improved driving characteristics.
